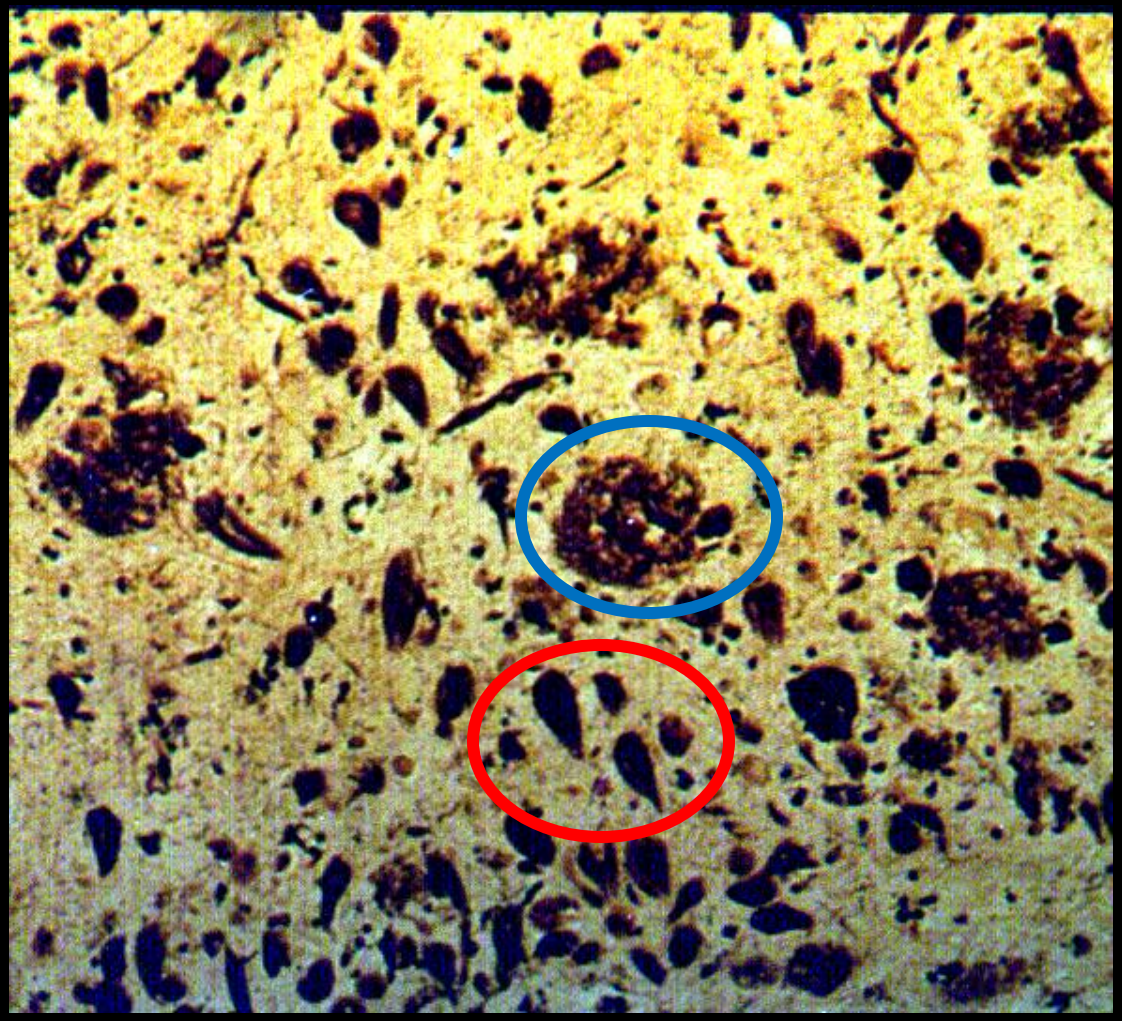
- Amyloid-β (Aβ)

**Neurofibrillary tangles**

- Intra-cellular
- Tau



# Importance of Measuring Plaques and Tangles During Life

- Enable study of disease dynamics in humans
  - No single animal model recapitulates all elements of human disease
- Better diagnosis
  - Clinical diagnosis of AD only ~70%-80% accurate compared to autopsy
- Early detection and intervention
  - Pathology begins 15 years or more before symptoms
- Improve drug trials
  - Require biomarkers for subject inclusion
  - Determine if drugs engaging target

# Outline

- Amyloid PET: the molecular imaging revolution
  - Early detection, preclinical disease
  - FDA approval, reimbursement: IDEAS Study
  - Biomarker-oriented clinical trials
- Tau PET: an emerging tool
  - Aging to AD continuum
  - Non-AD tauopathies
- Fluid-based biomarkers (Dr. Jim Hendrix)
  - CSF
  - Blood

# Decision Memo for Beta Amyloid Positron Emission Tomography in Dementia and Neurodegenerative Disease (CAG-00431N)

- **Insufficient evidence of clinical utility to justify coverage of Aβ PET**
- **Reimbursement would be considered under coverage with evidence development (CED) in clinical studies designed to:**
  - *Develop better treatments or prevention strategies for AD*
  - *Identify subpopulations at risk for developing AD*
  - *Resolve clinically difficult differential diagnoses (e.g., frontotemporal dementia versus AD)*
- **Must demonstrate Aβ PET improves health outcomes (short-term outcomes related to changes in management as well as longer-term dementia outcomes)**

IDEAS

Imaging Dementia—Evidence For Amyloid Scanning

IDEAS-Study@acr.org

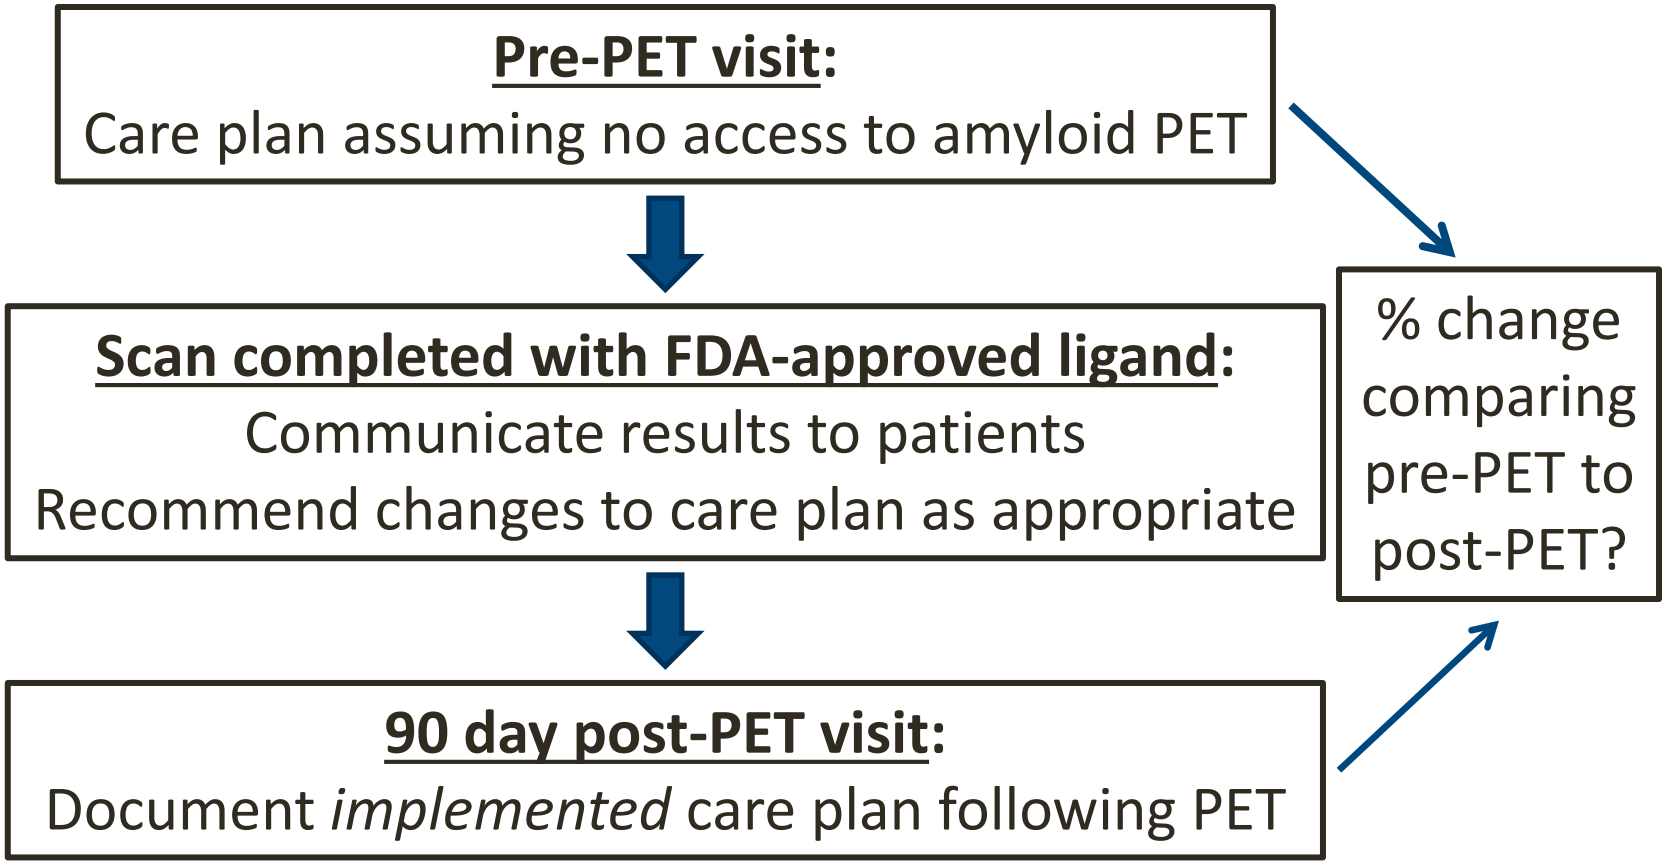
IDEAS-Study.org

- National, open-label study on utility of amyloid PET in ~18,500 Medicare beneficiaries with mild cognitive impairment (MCI) or dementia of uncertain etiology
  - Eligible patients referred for PET by dementia experts
  - Scans covered by CMS, performed and interpreted locally
- Aim 1: Impact of scan on management plan at 3 months
- Aim 2: Impact on major medical outcomes at 12 months
- *The primary hypothesis is that, in diagnostically uncertain cases, amyloid PET will lead to significant changes in patient management, and this will translate into improved medical outcomes*

# Interim Analysis: Objective

- To report early results assessing changes in patient management in the first 3,979 participants in whom case report forms were completed before and ~90 days after PET
- This represents a pre-specified analysis to assess the feasibility of detecting a ≥ 30% change in management based on observed results in the first 1/3 of the Aim 1 cohort

# Aim 1 Study Flow



IDEAS
Imaging Dementia—Evidence For Amyloid Scanning

# Methods: Analysis

- **Primary outcome: change in composite score:**
  - Change in AD drugs (cholinesterase inhibitors or memantine)
  - Change in non-AD drugs
  - Change in counseling and planning
- **Interim analysis sample size: N=3,979 completed post-PET**
  - 1/3 of total Aim 1 accrual (N=11,050, 80% power to detect ≥ 30% change in MCI and dementia)

# Demographics, N=3,979

## 64.3% MCI, 35.7% dementia

| *Characteristic* | *MCI* | *Dementia* | *All* |
|---|---|---|---|
| Age, mean (s.d.) | 75(6.1) | 77(6.5) | 75(6.3) |
| Sex, n female (%) | 1,281(50.0) | 736(51.9) | 2,017(50.7) |
| Caucasian, n (%) | 2,349(91.7) | 1,248(88.0) | 3,597(90.4) |
| MMSE, mean (s.d.) | 26(3.3) | 20(5.5) | 24(5.0) |
| MoCA, mean (s.d.) | 22(3.8) | 17(5.8) | 20(5.1) |
| Leading suspected etiology AD, n (%) | 1,895(74.0) | 1,141(80.5) | 3,036(76.3) |
| Taking AD drugs at enrollment, n (%) | 951(37.1) | 919(64.8) | 1,870(47.0) |
| PET results, n (% positive for β-amyloid) | 1,391(54.3) | 999(70.5) | 2,390(60.1) |

MMSE – Mini-Mental State Exam; MoCA – Montreal Cognitive Assessment

# Change by Management Domain

| Domain | MCI | Dementia |
|---|---|---|
| AD drugs | 47.8% | 47.7% |
| Non-AD drugs | 36.0% | 32.2% |
| Counseling | 23.9% | 15.9% |
| Overall | 67.8% | 65.9% |

Rabinovici et al., AAIC 2017

# More Precise Diagnosis and Treatment Post-PET

- **Concordance between diagnosis and PET results**
  - Pre-PET diagnosis AD: 61.2% amyloid PET+
  - Pre-PET diagnosis non-AD: 54.5% amyloid PET+
- **PET led to changes in diagnosis**
  - In patients with *positive* scan, rate of AD diagnosis *increased* from 78.5% pre-PET to 95.2% post-PET
  - In patients with *negative* scan, rate of AD diagnosis *decreased* from 73.0% pre-PET to 14.5% post-PET
- **PET modified use of AD drugs**
  - In patients with *positive* scan, use of AD drugs *increased* from 50.9% pre-PET to 83.8% post-PET
  - In patients with *negative* scan, use of AD drugs *decreased* from 39.1% pre-PET to 30.8% post-PET

## ABSTRACT

Biomarkers have become an essential component of Alzheimer disease (AD) research and because of the pervasiveness of AD pathology in the elderly, the same biomarkers are used in cognitive aging research. A number of current issues suggest that an unbiased descriptive classification scheme for these biomarkers would be useful. We propose the "A/T/N" system in which 7 major AD biomarkers are divided into 3 binary categories based on the nature of the pathophysiology that each measures. "A" refers to the value of a β-amyloid biomarker (amyloid PET or CSF $A\beta_{42}$); "T," the value of a tau biomarker (CSF phospho tau, or tau PET); and "N," biomarkers of neurodegeneration or neuronal injury ($[^{18}F]$-fluorodeoxyglucose–PET, structural MRI, or CSF total tau). Each biomarker category is rated as positive or negative. An individual score might appear as A+/T+/N−, or A+/T−/N−, etc. The A/T/N system includes the new modality tau PET. It is agnostic to the temporal ordering of mechanisms underlying AD pathogenesis. It includes all individuals in any population regardless of the mix of biomarker findings and therefore is suited to population studies of cognitive aging. It does not specify disease labels and thus is not a diagnostic classification system. It is a descriptive system for categorizing multidomain biomarker findings at the individual person level in a format that is easy to understand and use. Given the present lack of consensus among AD specialists on terminology across the clinically normal to dementia spectrum, a biomarker classification scheme will have broadest acceptance if it is independent from any one clinically defined diagnostic scheme. *Neurology*® 2016;87:539–547

# Take Home Points

- Amyloid PET is already in the clinic
  - Support clinical diagnosis with molecular biomarker
  - Strong effect on patient diagnosis and care plan
  - Impact on patient outcomes under evaluation
  - Major role in trials and drug development
- Tau PET a powerful tool in aging-AD spectrum
  - Study relationships between Aβ, tau, neurodegeneration and cognition
  - Unlike Aβ, tau PET correlates with cognition and disease progression
  - Potential to capture non-AD tauopathies
